CC The variants can be used to promote development, maintenance and CC regeneration of neurons in vivo or in vitro, so can be used to treat a CC wide range of neural diseases, e.g. Alzheimer's, Parkinson's, CC Huntington's and Meniere's diseases; stroke; amyotrophic lateral CC sclerosis; epilepsy; Down's syndrome; nerve deafness; Bell's palsy, or CC specifically, peripheral neuropathy. They are also used as cognitive enhancers and can also be used for diagnosis; in animal feeds; as CC enhancers and for generation of specific antibodies. By introducing trkC CC media, and for generation of specific antibodies. By introducing trkC CC indiding/signal inducing activity, the variants acquire the activity of CC neurotrophic factor NT-3 while optionally retaining ability to bind trkA and/or B and therefore provide several activities in a single molecule, with more predictable pharmacokinetic and other properties than a mixture of agents each with a single activity, and better pan-neurotrophic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        á

Ototoxicity-related balance impairments include Meniere's syndrome, myringitis, otitis media, acute vestibular neuronitis, herpes zosteroticus, labyrinthitis, middle or labyrinthe tumours, petrositis and otosclerosis. NT-4/5 may also be used to treat diseases induced by gram positive, gram negative and acid-fast bacteria. The present sequence is a protein used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to treating ototoxin-induced neuronal-related balance impairment in a mammal by administering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; Column 57-58; 40pp; English

          This invention relates to a matrix comprising a substrate capable of providing attachment of a heparin binding peptide (HBP), a peptide comprising a binding domain which binds heparin with high affinity, heparin or heparin-like polymer, and a protein growth factor or peptide fragment which has a domain that binds heparin with low affinity. Included in the invention is a vascular graft comprising the matrix, which is capable of supporting cell adhesion. The matrix is used for delivering low heparin binding affinity growth factor proteins or peptides in a controlled manner suitable for wound healing. The matrix can be used in an article for treating dermal wounds, and in an implantable sterilized composition capable of supporting cell adhesion. The present sequence represents a growth factor protein. The protein is used in an example illustrating that non-heparin-binding growth factors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sclerosis, Bell's palsy, and various conditions involving spinal muscuatrophy, or paralysis. They are also useful for treating other human neurodegenerative disorders, such as Jackeimer's disease, Parkinson's disease, wiltiple sclerosis, Huntington's disease, Down's Syndrome, nerve deafness, Menlere's disease and other conditions characterized by necrosis or loss of neurones, whether central,

     The sequence is that of a chimeric neurotrophic factor (NF) R1 which comprises the preprosequence of human brain derived neurotrophic factor (hBDNF) and the full mature sequence of human neurotrophic growth factor (hNGF). It may provide the activity of 2 NFs in a single mol. or may serve as a superagonist of an endogenous NF thereby enabling an increased biological response at lower doses. It may also be useful in targeting an active cpd. to cells responsive to NF. The design of chimeric Nfs, such as R1, which retain specific biological activity but which are directed to a subset of factor-responsive cells may enable treatment of neurological disorders but avoid the complications of more widespread activity
                                                                                                                                                                                                 New chimeric neurotrophic factors - useful in treating conditions caused by trauma, surgery, ischaemia, infect metabolic diseases, nutritional deficiency, etc.

It may also be used to treat patients whose nervous system has been damaged by trauma, surgery, ischemia, infection (e.g. polio or AIDS), metabolic disease, nutritional deficiency, malignancy or toxic agents. Also to treat e.g. Alzheimer's disease, ageing, peripheral neuropathies, Parkinson's disease, Huntington's chorea or amyotrophic lateral sclerosis. The NF or antibodies to it can also be used in the diagnosis and study of nervous system disorders. See also AAR21852-R21874 and AAQ22080-Q22131.

                                                                                                            The sequence was deduced from a clone isolated from a lambda EMBL3 genomic library prepd. from human leukocyte DNA, using a probe synthesised based on the sequence of the known human NGF gene [A. Ullrich et al., Nature 303, 821 (1983)]. The clone, betaLN2113, isolated from the library was cleaved with Smal and ApaI to remove a lkb fragment contg. the gene which was then inserted into plasmid pBluescript IIK to obtain pNGFP107G. The gene was sequenced from this plasmid using Seekhase (Blochemical). The sequence of the protein colding values found to be a contracted from the contra
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               EP414151-A.

pGGN301. S. cerevisiae NA74-3A(rho-)/pGGN301 (FERM-P2532) contains the expression vector and is useful for the prodn. of human NGF. The NGF is used as a reagent to study the cerebral nerve systematic and to treat senile dementia.
Nerve growth factor; neurotrophic protein refolding; NGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A human NGF gene (obtd. from pNGF107G) or its chemically synthesised DNA were used, opt. cleaved by restriction enzymes. In the human NGF, arginine and alanine may added to the C-terminal. A fragment of pNGF107G was ligated into pGLD906-1 contg. a GLD promoter to obtain pGGN228. DNA comprising nucleotides 1-99 of this sequence and a partial sequence of pGGN228 and pGLD906-1 were ligated to obtain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure; Fig 1+3; 11pp; Japanese

useful for promoting the survival and maintaining phenotypic
differentiation of nerve and glial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             27-JUN-1994;
09-MAY-1994;
                                                                                                                                                                                                                                                                                                                                                                                                                       maintaining the phenotypic differentiation of nerve and glial cells, is isolated and purified. This method breaks incorrectly formed disulphide bonds and allows refolding of the factor into the correct tertiary structure required for maximum yield of full active protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The nerve growth factor (NGF) gene is expressed in Escherichia coli cells. The recombinant protein is solubilized and sulfonylated and allowed to refold in the presence of PEG and biologically active NGF, used for promoting the survival of anomalic color of the survival of anomalic colors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 1995-404080/51.

                                                                                                                                                                                                                                                                                                                                     protein was used as an immunogen to generate a polycional antibody against hNGF. The polycional antibody can be used to detect and determine hNGF pref. by enzyme immunoassay.

The fusion protein comprises three domains joined together in order, from N-terminus to C-terminus, of a first domain comprising a protein of interest, a second domain comprising a hydrophilic spacer and an affinity domain, each domain comprising amino acid residues. The present sequence represents human prepronGF, used in example 6 of the present invention. The recombinant vector is used for the production of authentic recombinant proteins of interest. The method of the invention is useful for the expression of fusion proteins capable of isolation by affinity chromatography in pro- or eukaryotic cells. This method allows for the efficient cleavage and generation of authentic proteins of interest that do not contain extraneous (i.e. non-naturally occurring) amino acids
                                                                                                                                                                                                                                                                                                                                                                                                                                      Key
